Overview

What are client-side View Models for?
Using FluentValidation client-side
Validation in Angular

Client-side View Models

- Helpful in TypeScript scenarios
- Could use JS 'classes' or 'interfaces'
- Doesn't guarantee anything
- Client-side Validation is for UX
 - Not for security

Demo

Client-side View Models

Client-side FluentValidation

- Just generates ASP.NET validation
- Only works with these validators:
 - NotNull/NotEmpty
 - Matches
 - InclusiveBetween
 - CreditCard
 - Email
 - EqualTo
 - MaxLength
 - MinLength
 - Length

What We've Learned

Validation on the client-side isn't magically secure

Often you'll need to duplicate validation from the server

View models are useful but not a panacea in JavaScript or TypeScript

Wrap-up

Best Practices in ASP.NET Core Entities, Validation, and View Models

- Thanks for joining me!
- I hope you've learned some lessons
